Stock Assessment and Management Evaluation Strategy Process

Background: SAP Data Use for Assessments

The SAP uses “corrected” catch data for stock assessments

- **Corrected catch = Observed catch + Accepted logbook catch + Logbook catch corrections + Logbook releases corrections**

Bycatch species (e.g., sharks)

- **Logbook catch corrections: statistical model estimates**
- **Logbook releases corrections: PIROP observers' rates**

Incidentally caught species (e.g., istiophorid billfishes):

- **Logbook catch errors: identified by statistical model**
- **Logbook catch corrections: verified with sales records**
- **Logbook releases corrections: PIROP observers' rates**

Major Problem with Catch Data: Under-Reporting Shark Catches in Logbooks

Major Problem with Catch Data: Misidentifications of Istiophorid Billfishes

Blue marlin: mean catch per set in 1°squares, September-December 1995

Blue marlin - catch per set, Sept-Dec 1995

Catch History Correction:

Integrated use of multiple data sets

**Observer catch
data (response)**

&

**Observer
operational &
environmental
data (predictors)**

**Statistical model
fitting**

```
graph LR; A[Observer catch data (response)] --> D[Statistical model fitting]; B[Observer operational & environmental data (predictors)] --> D;
```

**Model coefficients
applied to logbook
data (same predictors)**

**Possible outliers
evaluated using
regression techniques**

```
graph LR; C[Model coefficients applied to logbook data (same predictors)] --> E[Possible outliers evaluated using regression techniques];
```

**Correction or
replacement of errors**

**CPUE standardized
with most accurate data**

```
graph LR; F[Correction or replacement of errors] --> G[CPUE standardized with most accurate data];
```

CPUE Standardization: Analytical Complexities

- **Discontinuous time series in the shallow-set sector**
- **Catchabilities on longline gear may differ between targets and bycatch or incidentally caught species, making identification of explanatory variables difficult.**
- **Zero inflation often typical of catch data for bycatch or incidentally caught species.**
- **The geographic expanse of the fishery, typical operational procedures, and regulatory regime have changed during the last decade.**

CPUE Standardization: Excess Zeros as Analytical Complexities

CPUE Standardization: Excess Zeros as Analytical Complexities

CPUE Standardizations: Strengths of these Analyses

- **Multiple standardization models (e.g., delta-lognormal, delta-Gamma, Poisson, negative binomial, zero-inflated Poisson, zero-inflated negative binomial) developed and compared for fit using objective method (Akaike weights).**
- **Comparable results (i.e., high correlations and small angular deviations among CPUE trajectories) with several models indicate that findings are robust.**

Species of Interest:

Completed Work with Sharks

Blue shark

(*Prionace glauca*)

**ISC stock assessment
in progress; expected
completion July 2013**

Oceanic whitetip shark

(*Carcharhinus longimanus*)

**CPUE standardizations
completed; zero-inflated
negative binomial model
selected by objective method**

Analytical Complexities:

Blue Shark Bycatch in a Changing Fishery

Blue Sharks

1996 Caught

Blue Sharks

2001 Caught

Blue Sharks

1996 CPUE

Blue Sharks

2001 CPUE

Analytical Complexities:

Blue Shark Bycatch in a Changing Fishery

Species of Interest:

Several CPUE Standardization Models Yield Consistent Trends with OWT Shark

Species of Interest:

Ongoing or Completed Work with Marlins

Blue marlin
(Makaira nigricans)

Comparative evaluation of zero-inflated and other CPUE standardization models is in progress. ISC stock assessment completed in May 2013.

Striped Marlin
(Kajikia audax)

ISC stock assessment completed in July 2012. CPUE standardization favorably reviewed in December 2012.

Species of Interest:

Stock Assessment Work Scheduled for 2014

Swordfish

(*Xiphias gladius*)

The ISC BILLWG will conduct a swordfish stock assessment in 2014.

Shortfin mako

(*Isurus oxyrinchus*)

The ISC SHARKWG will conduct a shortfin mako stock assessment in 2014.

Conclusions

- **Data use procedures have proven useful for the stock assessments:**
- **Working papers submitted to the ISC SHARKWG and BILLWG included detailed data preparation procedures, analyses of deviance, model selection procedures, residuals plots, and other diagnostics.**
- **Documents exemplified “Best Available Science” standards.**
- **CPUE standardizations favorably reviewed.**
